Covid-19 Vaccination Campaign in Germany

The data used here were provided by Robert Koch Institute and the German federal ministry of Health.

These institutions publish the datasets and some analysis on the page impfdashboard.de.

Setup

Imports

```
In [66]: # standard library
import datetime
import math

In [67]: # third party
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
import requests
import seaborn
```

Date this Notebook was run

```
In [68]: today = datetime.datetime.today().strftime('%Y-%m-%d')
today

Out[68]: '2021-07-06'
```

Set Defaults

localhost:8888/lab 1/19

```
In [71]: | population_germany = 83_200_000
```

Get and Transform Data

```
In [72]: vaccination_data_permalink = 'https://impfdashboard.de/static/data/germany_vaccinations_timeseries_v2.tsv'
vaccinations = pd.read_csv(
    vaccination_data_permalink,
    sep="\t")
```

Drop unnecessary / misleading columns

Columns with names starting with 'indikation' will not be analyzed as the data providers stopped updating them.

```
In [73]: cols_to_drop = vaccinations.columns[vaccinations.columns.str.contains('indikation_')]
    vaccinations.drop(columns=cols_to_drop, inplace=True)
```

Some more columns can be dropped, as there is no interest in analyzing differences on a vaccine level - especially since in some cases vaccines were mixed.

Some columns are labeled misleadingly. As stated by the data provider the columns | personen_erst_kumulativ | and | impf_quote_erst | contain people vaccinated with the Johnson & Johnson vaccine. As this requires only one shot, the same persons are included in | personen_voll_kumulativ . Therefore more columns are dropped and recalculated later.

```
In [75]: vaccinations.drop(columns=['impf_quote_erst', 'impf_quote_voll'], inplace=True)
```

Convert datatype of date column

```
In [76]: vaccinations.iloc[ : , [0]] = vaccinations.iloc[ : , [0]].apply(pd.to_datetime)
```

Show Data

localhost:8888/lab 2/19

```
RangeIndex: 191 entries, 0 to 190
